DAY - 4 OTHER PROTOCOLS IN ACTION

Assignment - 12

1. **Install FileZilla Server on your Windows machine, create a user account, and set up a shared folder for FTP access.**

➢

FileZilla Server is used to transfer and share files between computers over a network using FTP.

1. **Open FileZilla Server and navigate to the Users section.**
2. **Click Add and create a new user account named ftpuser.**
3. **Enable password authentication and set a password for the user.**
4. **Go to Shared Folders and add the folder C:\FTP_Shared.**
5. **Assign permissions such as Read, Write, Delete, and Append to the shared folder.**
6. **Create the FTP_Shared folder on the Windows computer.**
7. **Allow FileZilla Server through Windows Defender Firewall.**
8. **Open FileZilla Client and enter the host address 127.0.0.1, username ftpuser, password, and port 21.**

9. **Click Quickconnect to test the FTP connection. After successful login, the shared folder and its files will be visible.**

Result: FileZilla Server was configured successfully with an FTP user account named ftpuser and a shared folder named FTP_Shared. The connection was tested using FileZilla Client, and the shared files were accessible through FTP.

2. **Use FileZilla Client to connect to your FTP server using the credentials you created, and upload any image file from your computer to the shared folder.**

➢

1. **Open FileZilla Client on your Windows computer.**
2. **Enter the FTP server details:**
    - **Host: 127.0.0.1**
    - **Username: ftpuser**
    - **Password: Your created password**
    - **Port: 21**
3. **Click Quickconnect to connect to the FTP server.**
4. **After successful connection, locate an image file on your computer in the left-side (Local site) panel.**
5. **On the right-side (Remote site) panel, open the shared folder FTP_Shared.**
6. **Select any image file (e.g., photo.jpg) from the left panel.**
7. **Right-click the image and select Upload.**
8. **Wait for the transfer to complete.**
9. **Check the right-side panel to verify that the uploaded image is visible in the shared folder.**

Result: Successfully connected to the FTP server using FileZilla Client with the created username and password. An image file was uploaded from the local computer to the FTP_Shared folder, and the uploaded file was visible on the server.

3. **Download the uploaded file from your FTP server to a different folder on your computer using FileZilla Client, and verify the file size matches the original.**

➢

1. **Open FileZilla Client and connect to the FTP server using the previously created username and password.**
2. **Enter the host 127.0.0.1 and port 21, then click Quickconnect.**
3. **Open the FTP_Shared folder in the right-side (Remote site) panel.**
4. **Locate the previously uploaded image file.**
5. **In the left-side (Local site) panel, select a different folder, such as C:\FTP_Downloads.**
6. **Right-click the image file on the remote side and select Download.**
7. **Wait for the file transfer to complete.**
8. **Open the original and downloaded image files and check their sizes using Properties.**
9. **Compare both file sizes to confirm that they match.**

Result: The image file was successfully downloaded from the FTP server to a different folder on the computer. The original and downloaded file sizes matched, confirming that the file was transferred successfully without any size difference.

4. **Research and list 3 real-world scenarios where SNMP is used in network management for apps or services you use (such as ISPs, campus WiFi, or large websites).**
   Hint: Think about how network admins monitor device health, bandwidth, or uptime.

➢

3 Real-World Scenarios Where SNMP Is Used in Network Management

Introduction:

SNMP (Simple Network Management Protocol) is used by network administrators to monitor and manage network devices such as routers, switches, servers, and access points. It helps check device health, bandwidth usage, network performance, and uptime.

1. Internet Service Providers (ISPs)

ISPs use SNMP to monitor routers, switches, and internet connections. It helps administrators check bandwidth usage, network traffic, and device status. If a router stops working or network traffic becomes high, SNMP helps identify the problem.

2. College and Campus WiFi

Colleges use SNMP to monitor WiFi routers, switches, and wireless access points across the campus. It helps administrators check the number of connected devices, internet usage, and access point health. It also helps detect network failures and maintain smooth internet connectivity for students.

3. Large Websites and Online Services (Amazon/Flipkart)

Large websites like Amazon and Flipkart use network monitoring systems to monitor their servers, switches, and network devices. SNMP helps administrators monitor device performance, bandwidth, and uptime. It helps identify network problems quickly and maintain reliable services for users.

5. **Create a table comparing FTP and HTTP across at least 5 points: port number, security, data transfer method, use cases, and authentication.**

➢

Comparison Point	FTP	HTTP
Full Form	File Transfer Protocol	Hypertext Transfer Protocol
Port Number	21 (control), 20 (traditional active-mode data)	80 (default)
Security	Basic FTP is not encrypted; FTPS provides encryption.	Basic HTTP is not encrypted; HTTPS provides encryption.
Data Transfer Method	Transfers files between client and server.	Transfers web pages and other web content between browser and server.
Use Cases	Uploading and downloading files from an FTP server.	Accessing websites and web applications.
Authentication	Supports username and password authentication; anonymous access is also possible.	Usually does not require authentication to access public websites.
Example	FileZilla Client used to upload and download files.	Chrome browser used to access websites like Google and Amazon.
